Releasing the Fewchurs Android SDK

Build, publish to Maven Central, and confirm it's live. Package: **shop.fewchurs:fewchurs-android** and **shop.fewchurs:fewchurs-core**. Code: github.com/fewchurs/fewchurs-kotlin

A. One-time setup (new computer only)

1. Install **Android Studio** and **JDK 17**.

   ```
   brew install openjdk@17
   ```

   Windows: install Temurin 17 from adoptium.net.

2. Tell the terminal where Java is (Mac). Then open a new terminal.

   ```
   J=/opt/homebrew/opt/openjdk@17/libexec/openjdk.jdk/Contents/Home
   echo "export JAVA_HOME=$J" >> ~/.zshrc
   ```

3. Get the code.

   ```
   git clone https://github.com/fewchurs/fewchurs-kotlin.git
   ```

4. Open the project once in Android Studio. This creates **local.properties** (the Android SDK location).

5. Copy **~/.gradle/gradle.properties** from the old computer to the same place (Windows: C:\Users\<you>\.gradle\). It holds the Sonatype token and signing key.

   Treat it like a password: USB or password manager only. Never email, chat or commit it. No old computer? Run ./tools/setup-publishing.sh to make a new key and enter a new Sonatype token (central.sonatype.com > Account > Generate User Token).

B. Build and test

1. Go into the project folder.

   ```
   cd ~/Desktop/fewchurs-kotlin
   ```

2. Set the new version in **gradle.properties**. Never reuse a number.

   ```
   VERSION_NAME=1.0.1
   ```

   Fix = 1.0.1 New feature = 1.1.0 Breaking change = 2.0.0. Also update CHANGELOG.md and the version in README.md.

3. Run the tests and a release build. It must end with **BUILD SUCCESSFUL**.

   ```
   ./gradlew test :sample:assembleRelease
   ```

   Windows: gradlew.bat instead of ./gradlew

C. Publish to Maven Central

1. Upload. Nothing is public yet after this step.

```
./gradlew publishToMavenCentral
```

2. Open **central.sonatype.com/publishing** and go to **Deployments**. Press **Refresh**.

3. Wait until the new deployment says **VALIDATED**.

   FAILED? Open it, read the errors, press Drop (nothing goes public), fix, and upload again.

4. Press **Publish**. The status changes to **PUBLISHED**.

   This can't be undone. The version can never be changed or deleted.

D. Confirm it's live

1. Wait 10 to 30 minutes, then run (change 1.0.1 to your version). **200** = live. **404** = not yet, wait and retry.

```
V=1.0.1
U=https://repo1.maven.org/maven2/shop/fewchurs/fewchurs-android
curl -s -o /dev/null -w '%{http_code}\n' $U/$V/fewchurs-android-$V.pom
```

2. Or open in a browser and look for your version folder:

```
https://repo1.maven.org/maven2/shop/fewchurs/fewchurs-android/
```

3. Final check in a real app: change the version, then **Sync Now** in Android Studio.

```
implementation("shop.fewchurs:fewchurs-android:1.0.1")
```

   The search page on central.sonatype.com can take a few hours. The checks above are faster.

E. Finish

1. Commit, then push the code and a tag that matches the version (no "v").

```
git push origin main
git tag 1.0.1
git push origin 1.0.1
```

2. Update the website docs: change **const VERSION** in feature-request-web/src/app/docs/kotlin/page.tsx, then commit and push.

If something goes wrong

Problem	Fix
Unable to locate a Java Runtime	Step A2, then open a new terminal.
SDK location not found	Open the project in Android Studio once, or create local.properties with sdk.dir=/Users/<you>/Library/Android/sdk
no such file: ./gradlew	You're in the wrong folder. cd ~/Desktop/fewchurs-kotlin
FAILED: Could not find a public key	Signing key isn't on the keyserver yet. Drop, wait 20 to 30 minutes, upload again.
401 / unauthorized on upload	Sonatype token is wrong or expired. Make a new one and update ~/.gradle/gradle.properties.
